KEYMACRO is a free Mac OS X utility that lets you define a shortcut for an application that typically needs a modifier key to operate. KEYMACRO can be used to simplify complex keyboard shortcuts that require a modifier key, but that normally need to be assigned to a different application. It has three modes of operation: Shortcut Key Keyboard Shortcut Shortcut Prefix In Shortcut Key mode, the first item in the keyboard shortcut text box is the "key code" for the shortcut key you want to use. For example, if you wanted to bind the Command+T keyboard shortcut to a Windows application, the first item in the keyboard shortcut text box would be "Ctrl+T". You would then need to enter the corresponding application's shortcut key, which would be "T". In Keyboard Shortcut mode, the first item in the keyboard shortcut text box is the shortcut key that's associated with a given application. For example, if you wanted to bind the Command+T keyboard shortcut to Tweetbot, the first item in the keyboard shortcut text box would be "Ctrl+T", and "Tweetbot" would be the application that would be affected by this keyboard shortcut. In Shortcut Prefix mode, the first item in the keyboard shortcut text box is the shortcut key that's used to start a given application. For example, if you wanted to bind the Command+T keyboard shortcut to Tweetbot, the first item in the keyboard shortcut text box would be "Ctrl+T", and "Tweet" would be the application that would be affected by this keyboard shortcut. The syntax used for this mode is the same as with Keyboard Shortcut mode. Note that in Keyboard Shortcut mode, you can use the "Keyboard shortcut" key on your keyboard to generate the keyboard shortcut. This will generate the same shortcut in Keyboard Shortcut mode. If you've created an application that is already bound to a shortcut key, you can use the "Restore default shortcut" key on your keyboard to bind the shortcut key to your new shortcut key. At the Coded Thinking Conference and Expo held in Chicago at the end of March, in the Innovation Theatre, Gary Schyman, an industry leading database expert, spoke on, "Database Solutions for Bankers: The New Age of Research". Identification of a novel allele of the human alpha 2 subunit of the heterotrimeric G protein G(i2) in a family with history of mental retardation and hyperactivity. Mutations of the human G protein subunits have been implicated in various neurological and neuropsychiatric disorders. Most mutations have been identified by sequencing the G protein genes and by linkage studies, but mutational analysis of these genes has been done only in a few cases. We analyzed the entire coding region of the human G protein alpha subunit gene in a family with multiple mental retardation and hyperactivity (MR/H). By mutation analysis, we identified a novel mutation, Ala(120)Ser, in the G(i2) alpha subunit gene (GNAI2). The mutant protein showed an impaired GDP/GTP exchange and a lower specific activity, indicating that the mutant G(i2) alpha subunit could not function as a heterotrimeric G protein, but retained its ability to interact with Gbetagamma. No obvious morphological abnormality was found in the patients' brains and their cognitive impairment was probably not a result of any brain developmental defect. The observation that one of the three patients examined in this family had epilepsy could be a further manifestation of the pathogenesis of this disease, but further detailed studies are required.Q: Using the Heroku CLI to Connect to a Running App I'm using the Heroku CLI (cli-1.2.1) to connect to a running app on Heroku, and am having a very strange result. \$ hero
